DOVE Speech Developement And Testing Continues

The DOVE Recovery Team continues to monitor the DO-17 downlink frequency of 145.825 MHz and to examine the on-board computer (OBC) memory dumps. DOVE listeners have noted that the voice messaged has changed significantly since speech testing was commenced last weekend. At the present time the message has becomed "garbled" and unintelligible. The DOVE Recovery Team members are not sure of the exact cause of the message change but they have several theories that they are looking into. The most probable is that there is a software "bug" which is over writing the memory locations where the speech software resides. At the present time they do not feel that this is a set back and are so far pleased with the progress that they have made so far. Watch for further updates concerning DOVE in the AMSAT News Service (ANS) bulletins.
